
Appendix — one draft, end to end, in time order
You
Zotero
chitragupta corpus sync (corpus layer)
content/ ledger.sqlite
chitragupta.retrieval + chitragupta.passages
genre skill (.claude/skills/)
PostToolUse hook
chitragupta draft gate
chitragupta draft references
chitragupta draft render (pandoc / TeX Live)
CURATE — the only step that adds a paper
add papers, then Export BibTeX + files
papers/bibliography.bib + attachment tree
SYNC — deterministic, incremental, holds the run lock
chitragupta corpus sync
take content/pipeline.lock.db
upsert one row per citekey
which PDFs actually changed
extract text → content/parsed/*.txt
mark parsed / parse_failed / no_pdf
summary + stale list + exit 0 | 1 | 2
DRAFT — the generative half
"write a survey section on digital twin composability"
is the ledger populated?
N citekeys parsed
search(query, k)
ranked snippets, each tied to a real citekey
write content/drafts/<slug>.md
VERIFY — enforced mechanically, twice
every Write/Edit under content/drafts/
are these citekeys in the ledger, each with a parsed PDF?
loop
[until the gate exits 0 — you are shown nothing before that]
alt
[any citekey unresolved]
no
FAIL (exit 1)
the write is blocked
swap the key for one retrieval returned, or drop the claim — never invent one
[all resolvable]
yes
PASS (exit 0)
runs the gate again itself, before showing you anything
If the paper genuinely isn't in the corpus, the loop stops and the skill tells you to add it in Zotero and re-run sync.
PUBLISH
python -m chitragupta.draft references <draft>
bib_fields for exactly the cited citekeys
a
chitragupta.draft render --format pdf
content/rendered/<slug>.pdf
Layer 4, the review layer — afterwards, never a gate:
chitragupta review provenance · verbatim · coverage · synthesis
figure · uncited · quotation · agenda · support · union · digest
the skill runs verbatim scan itself, the rest are yours to run
reports land in content/review/, mirroring the draft
